

## House rules Spa

- **Please take a shower before use. Skin oil, make up, & hair products, fabric softener and chemicals in swimwear & jewelry make the water quality poor. For example, the water will become cloudy and foam when the jets are turned on.**
- **Try to remove as much jewelry as possible, jewelry can damage but also discolor. In addition, some jewelry can also influence the water quality.**
- **A sensor floats in the pool to monitor the water quality, it should not be removed. The bottom of the sensor is very sensitive and can malfunction.**
- **No food may be consumed in the bath, you can drink in the specially designed plastic glasses. Glass or tin is not allowed due to water quality and safety.**
- **It is not allowed to add products to the water, such as: shampoo, aroma, an effervescent ball or bath foam.**
- **Do not take the remote controls with you in the bath. Please leave it on the cupboard and operate it from there. Please dry your hands before using the remote control.**
- **When using the spa, the room can become very humid and stuffy. This is bad for our equipment but also for yourself. It is nice to ventilate by opening the door a bit or completely open. If the wind blows outside, it is good to put the door on the hook, so that the door does not break in a strong gust of wind**
- **The spa can be used throughout the stay, but there is a night's rest between 22:00 and 08:00, noise will then have to be limited.**
- **After use, please put the spa cover back on. Then check whether all flaps are properly seated so that it closes nicely. You may not sit or lie on the spa cover.**
- **Smoking is not allowed in this area**

---

In order to keep the water quality good, we have to do some maintenance on the water immediately. We always discuss the time of this with the guests. Using the buttons (Jets, Light, Temperature) on the spa can accidentally put the spa into sleep mode. This cools the spa by 10 degrees. You can see this because the display flashes and there is SL or EC in the image. You can change this by first pressing the button to lower the temperature followed by the light button. Do this until ST (standard mode) appears in the display. If there are any problems, you can always reach us on 06 14241736 (Erwin) or 06 15250345 (Saartje)

**If due to non-compliance with these house rules, the quality of the water has become very poor due to the addition of agents to the water or damage has occurred, this will be charged.**
